92 THOMAS RD PORT MURRAY, NJ 07865

We recommend the following range of dosage: 8 to 18 US fl. OZ. Per 100 lbs of cement for paving stones and concrete roof tile. For SRW units and other architectural block higher dosage rates may be recommended. These dosage rates are estimated, your actual rate should be determined by testing. We recommend consulting your ICT representative to help you determine the proper dosage rate and order of addition for your particular process. Never mix EC-60 with other ad-mixtures before application.
